

Titanium pad arm with **Open box**

How about trying a pad arm with a new type of open box? Dust or dirt does not accumulate on the bottom of the box!

By comparison, a conventional open box is opened by cutting the bottom part of a normal box. As a result, the end surface remains rounded and left and right sides are created.

In addition, the cost will be higher because the number of processes increases.

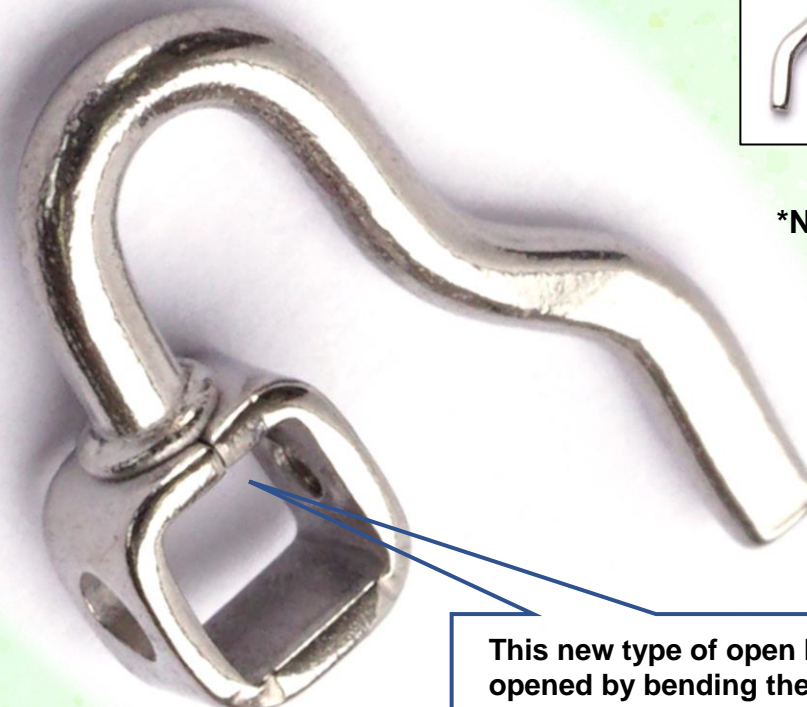

There is roundness

TPA-09

***No left and right sides**

This new type of open box is opened by bending the sheet material into a box shape and the arm is welded to the joint. There is no higher cost.
